Action1 Enrollment and Provisioning for Windows Autopilot

A practical guide for using Microsoft Intune and Windows Autopilot to enroll new Windows endpoints into Action1, assign the correct Action1 provisioning groups, run provisioning actions, and verify readiness from the Action1 Enrollment and Provisioning dashboard.

Use this guide when an organization wants Autopilot enrollment to land devices in Action1 with a repeatable provisioning workflow instead of treating agent deployment, software installation, configuration checks, and readiness reporting as separate manual steps.

Audience and Scope

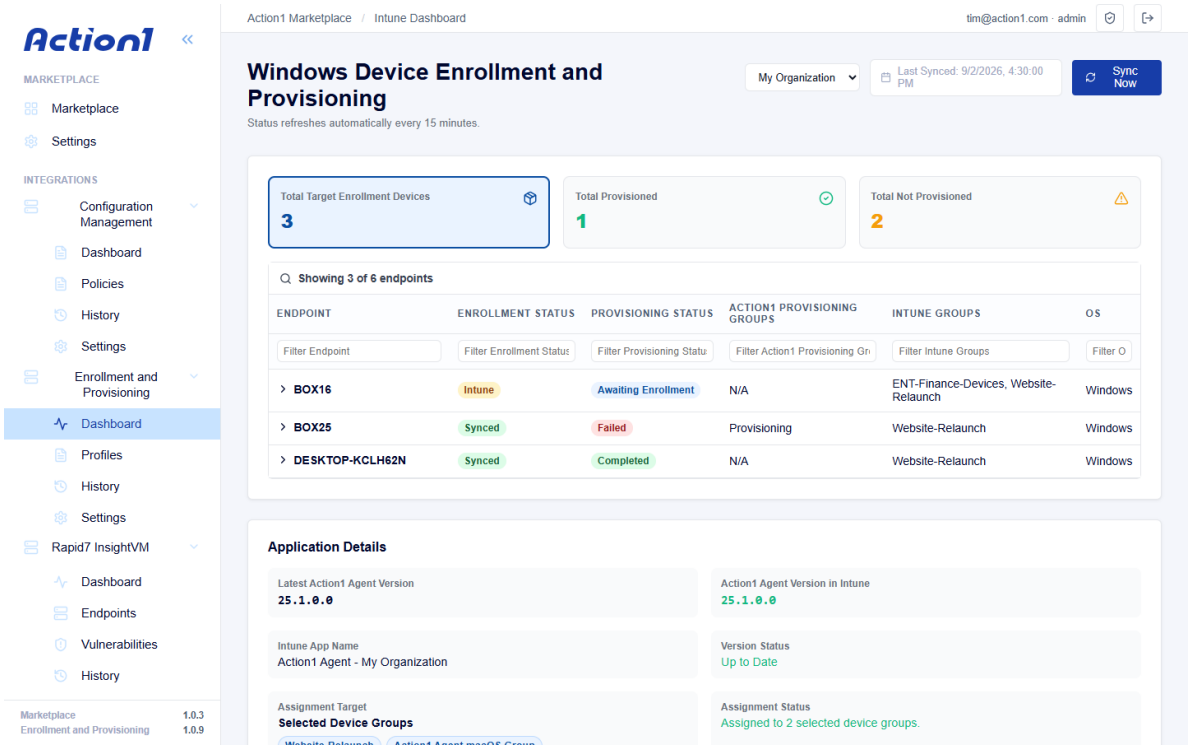

This guide is intended for endpoint engineering, IT operations, and security teams responsible for Windows Autopilot, Microsoft Intune, and Action1 administration.

- Covers the Action1 Enrollment and Provisioning profile workflow.
- Includes setup steps for registering Windows devices with Autopilot and confirming Intune management.
- Uses Action1 provisioning groups to determine which devices are monitored for provisioning readiness.
- Uses Action1 provisioning actions and Configuration Management policies to decide whether provisioning is complete.

Integration Model

Windows Autopilot brings the device through out-of-box setup and Intune enrollment. The Action1 Marketplace integration publishes and assigns the Action1 Agent app through Intune, then maps enrolled endpoints to Action1 provisioning groups for readiness tracking.

Layer	Role in the Workflow
Windows Autopilot	Registers devices and applies the Autopilot deployment profile during out-of-box setup.
Microsoft Intune	Assigns the Action1 Agent app to the selected enrollment groups and manages app installation during enrollment.
Action1 Marketplace	Connects Intune and Action1, stores enrollment and provisioning profiles, and surfaces dashboard status.
Action1 Provisioning Groups	Collect enrolled devices into groups used for provisioning readiness, reporting, and action targeting.
Provisioning Actions and Configuration Management	Install required software, run scripts, apply policies, and verify endpoint readiness.

Current dashboard view showing enrollment status, provisioning status, and target device counts.

Before You Begin

Confirm the following access and authorization requirements before starting the Action1 Enrollment and Provisioning profile workflow:

- Administrator access to Microsoft Intune and Microsoft Entra for Autopilot, group, app assignment, and app registration work.
- Permission to create or update a Microsoft Entra app registration, add Microsoft Graph application permissions, and grant admin consent.
- Administrator access to the Action1 Marketplace to enable the integration, save settings, and create Enrollment and Provisioning profiles.
- Action1 administrator access to the Action1 organization that will receive newly enrolled devices.

This guide walks through the remaining setup: register devices for Autopilot and Intune, assign Autopilot and Intune groups, configure Action1 Enrollment and Provisioning, and run the Autopilot enrollment workflow.

Recommended Group Alignment

Object	Recommended Alignment
Autopilot device group	Contains devices that receive the Autopilot deployment profile.
Intune enrollment group	Use the same group, or a tightly matched group, to receive the Action1 Agent assignment.
Action1 provisioning group	Use Action1 filters to collect devices after they enroll and begin provisioning.
Configuration Management policy target	Target the same Action1 provisioning groups used by the profile.

Step 1 - Register Devices for Autopilot and Intune

Before Action1 Enrollment and Provisioning can enroll devices through Intune, the Windows devices need to be known to Windows Autopilot and able to enroll into Intune automatically.

Enable Windows Automatic Enrollment

1. In the Microsoft Intune admin center, go to Devices > Enrollment.
2. Open the Windows tab and select Automatic Enrollment.
3. Set the MDM user scope to the users who should automatically enroll Windows devices into Intune.
4. Save the enrollment configuration.

Register Windows Devices with Autopilot

1. For new hardware, use OEM, reseller, or distributor registration when available.
2. For testing or existing devices, collect the device hardware hash and prepare the Autopilot CSV import file.
3. In the Intune admin center, go to Devices > Enrollment > Windows > Windows Autopilot > Devices.
4. Select Import, upload the CSV file, and wait for the device records to appear.
5. Confirm each imported device shows the correct serial number, group tag, and assigned user if those fields are used in your deployment model.

Manual hardware-hash collection is best suited for testing, evaluation, or existing devices. For production purchasing workflows, vendor registration is cleaner because the device can be associated with the tenant before it reaches the user.

Step 2 - Assign Autopilot and Intune Groups

Use Microsoft Entra security groups to connect Autopilot assignment, Intune app assignment, and Action1 enrollment.

Create or Confirm the Autopilot Device Group

The Autopilot device group is the Microsoft Entra security group that Intune uses to decide which registered devices receive an Autopilot deployment profile. For Action1 Enrollment and Provisioning, this group should represent the same device population that will later receive the Action1 Agent assignment.

1. In the Intune admin center, go to Groups and create a Microsoft Entra security group. Choose Dynamic Device membership when the group should populate automatically from Autopilot device attributes.
2. For one broad Autopilot group, use a dynamic membership rule that includes all registered Autopilot devices: `(device.devicePhysicalIDs -any (_ -startsWith "[ZTDid]"))`.
3. For separate enrollment populations, assign a Group Tag when importing Autopilot devices, then create a dynamic group for that tag. Group Tag maps to the Microsoft Entra device OrderID value. Example: `(device.devicePhysicalIds -any (_ -eq "[OrderID]:Finance"))`.
4. Use a manually assigned security group only for small pilots or exceptions where you want direct control over membership.
5. After import or rule changes, open the group and confirm the target device appears under Members before assigning the Autopilot deployment profile. Dynamic membership can take time to evaluate.

Use group tags when different device populations need different Autopilot experiences, different Action1 enrollment groups, or different provisioning expectations. Examples include department, region, operating model, or pilot versus production devices.

Create and Assign the Autopilot Deployment Profile

1. In the Intune admin center, go to Devices > Enrollment > Windows > Windows Autopilot > Deployment Profiles.
2. Create the appropriate profile type for the deployment model, such as user-driven Microsoft Entra join or self-deploying.
3. Assign the profile to the Autopilot device group.
4. Wait for Intune to assign the profile to the device. Profile assignment can take time because it depends on group membership, Autopilot processing, and service synchronization.

Confirm the Device Is Managed by Intune

1. Start the device through the Autopilot out-of-box experience.
2. Sign in with a user in the MDM user scope, when using a user-driven deployment.
3. After setup completes, confirm the device appears under Devices > Windows in the Intune admin center.
4. Open the device record and verify management state, primary user, compliance, and app install status.
5. Confirm the device is in the Intune enrollment group selected by the Action1 Enrollment and Provisioning profile.

Checkpoint	Why It Matters for Action1
Autopilot device record exists	The device can receive the intended Autopilot deployment profile.
Autopilot profile assigned	The device follows the correct enrollment experience during setup.
Automatic enrollment enabled	Windows can enroll into Intune during Autopilot.
Device appears in Intune	Action1 Enrollment and Provisioning can target it through the selected Intune enrollment group.
Action1 Agent app assignment applies	The endpoint can register into Action1 and enter the provisioning workflow.

Step 3 - Configure Action1 Enrollment and Provisioning

Configure the Action1 Marketplace integration, then create an Enrollment and Provisioning profile that maps the Action1 organization, Intune enrollment groups, Action1 provisioning groups, provisioning actions, and final review state. Multiple profiles can use the same organization when they use different provisioning groups.

Configure Marketplace Access

1. Open Marketplace Settings and confirm the shared Action1 API credentials and organization are configured.
2. Find the Enrollment and Provisioning integration in Marketplace and enable it.
3. Open the enabled integration and go to Settings.
4. Enter the Microsoft Intune tenant ID, client ID, and client secret from the Microsoft Entra app registration.
5. Validate the credentials, then select Save Settings.

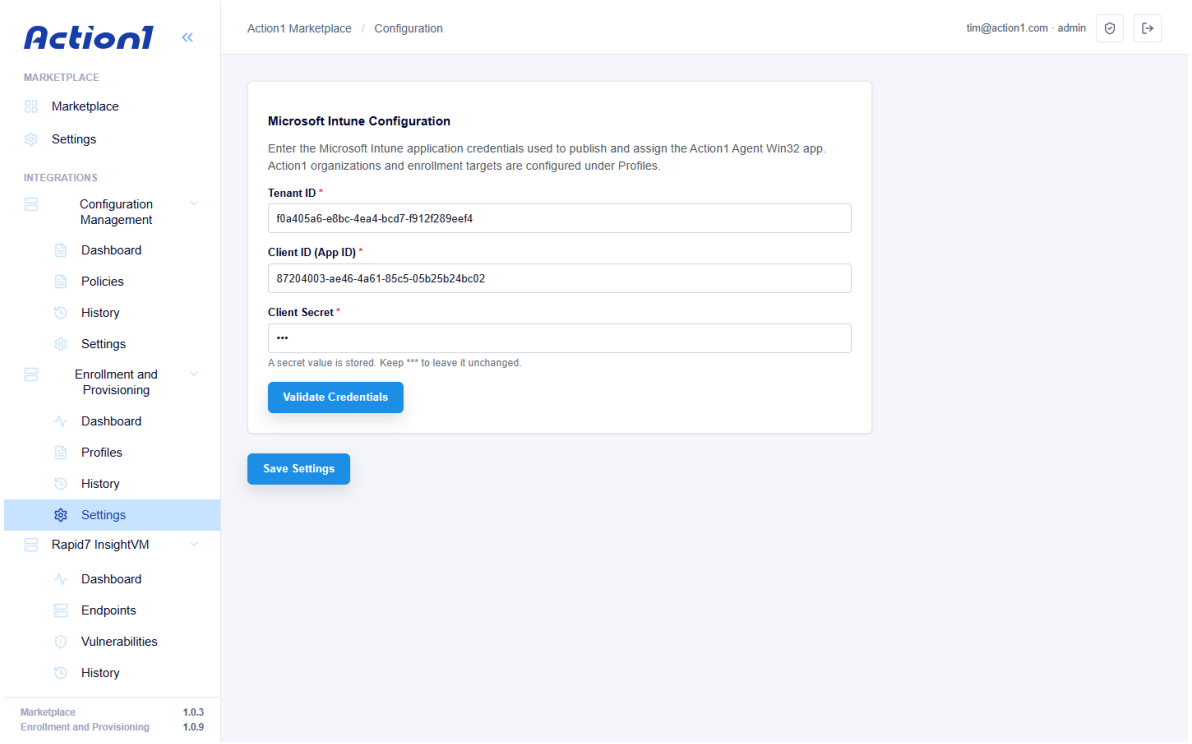

Action1 Enrollment and Provisioning must be able to discover Intune groups, publish or update the Action1 Agent app, read managed devices, and read assignment state. If any of those actions fail, resolve Microsoft Graph permissions before proceeding.

Client ID Permission Requirements

Configure the Microsoft Entra app registration used by the client ID with Microsoft Graph application permissions, then grant admin consent. Delegated user permissions are not used by this integration.

Permission	Use
DeviceManagementApps. ReadWrite.All	**Required.** Read, create, update, upload content for, and assign the Action1 Agent Win32 app.
DeviceManagementManagedDevices. Read.All	**Required.** Read Intune managed devices for Action1 enrollment comparison.
Group.Read.All	**Required.** List Intune device groups, validate selected group assignments, and read group membership.
Device.Read.All	**Required.** Read device properties when expanding group membership for endpoint group names.
Directory.Read.All	**Recommended.** Provides broader directory read access and helps prevent redacted group membership results in some tenants.

After adding permissions, select Grant admin consent in Microsoft Entra. A valid client ID and secret will still fail if admin consent has not been granted.

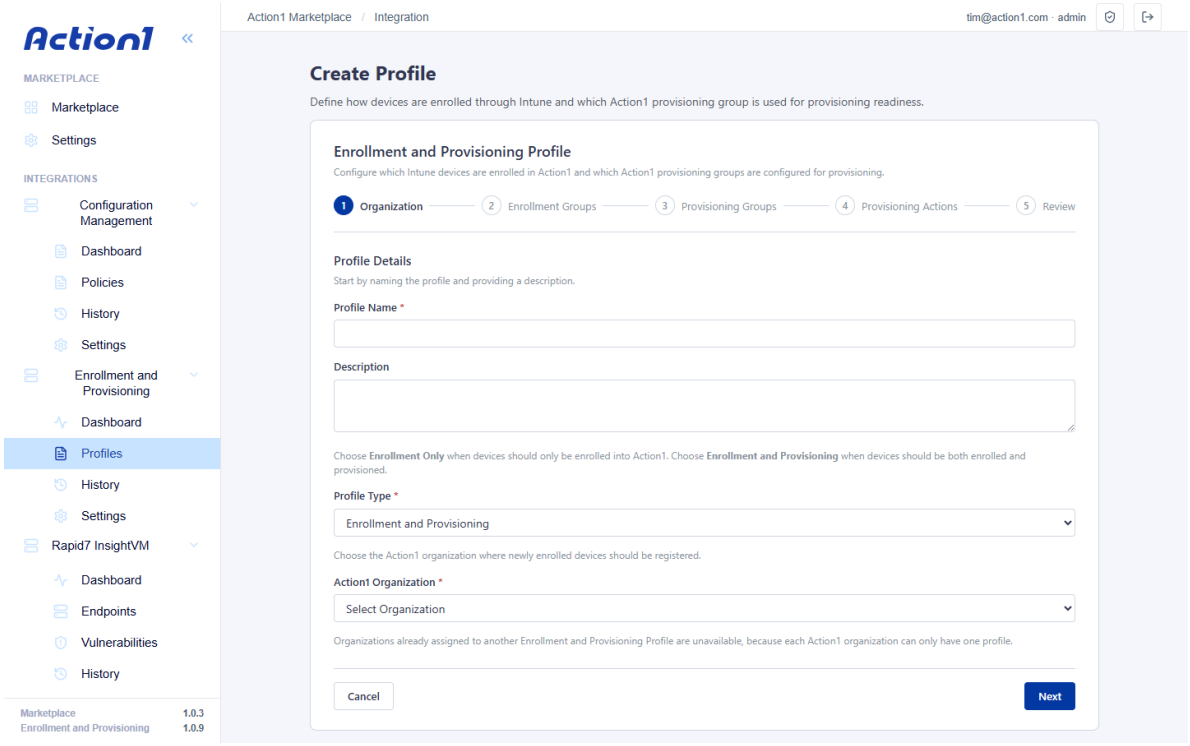

Current Settings view for configuring Microsoft Intune access used by the integration.

Create the Enrollment and Provisioning Profile

Use the profile wizard to define the Action1 organization, Intune enrollment groups, Action1 provisioning groups, provisioning actions, and final review state for the device population.

Profile Wizard Step 1 - Profile Details

1. Go to Profiles and choose Create Profile.
2. Enter a profile name and description.
3. Choose Enrollment and Provisioning when devices should be both enrolled into Action1 and provisioned.
4. Choose the Action1 organization where newly enrolled devices should be registered.

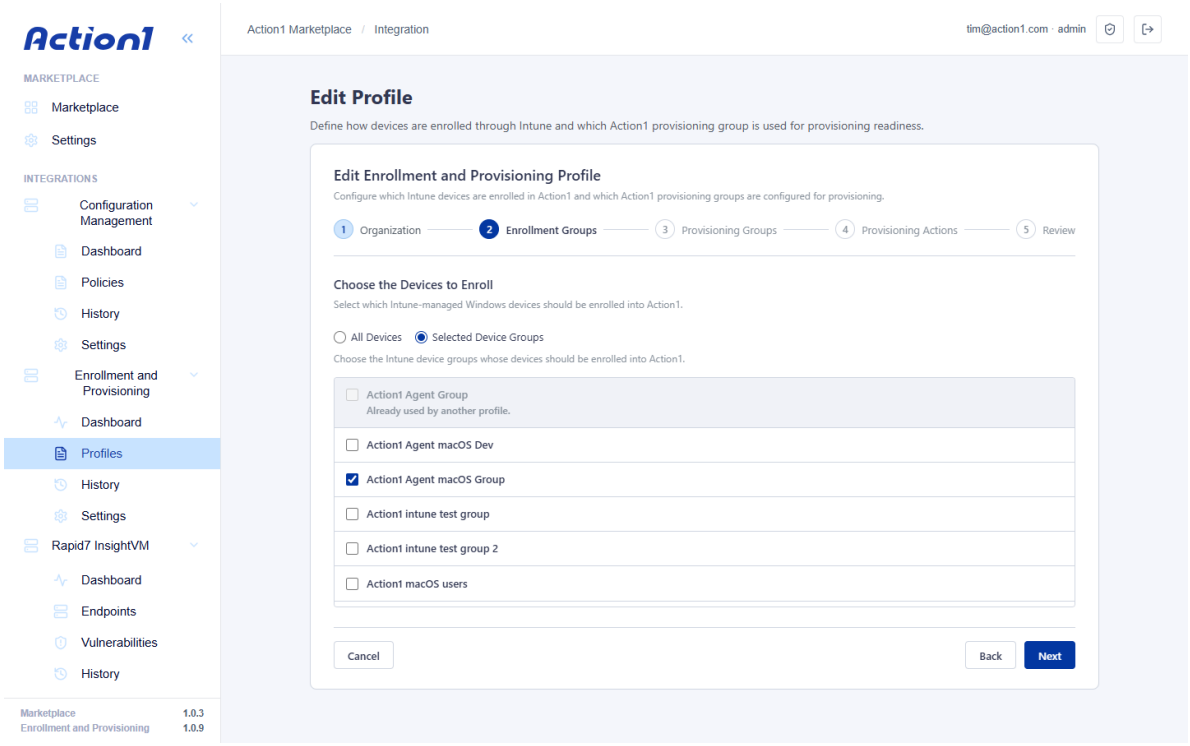

Current Profile Details step with Action1 organization and profile type selections.

Profile Wizard Step 2 - Enrollment Groups

1 Choose the Intune enrollment groups whose devices should be enrolled into Action1.

2 Confirm the selected groups match the intended Autopilot device population.

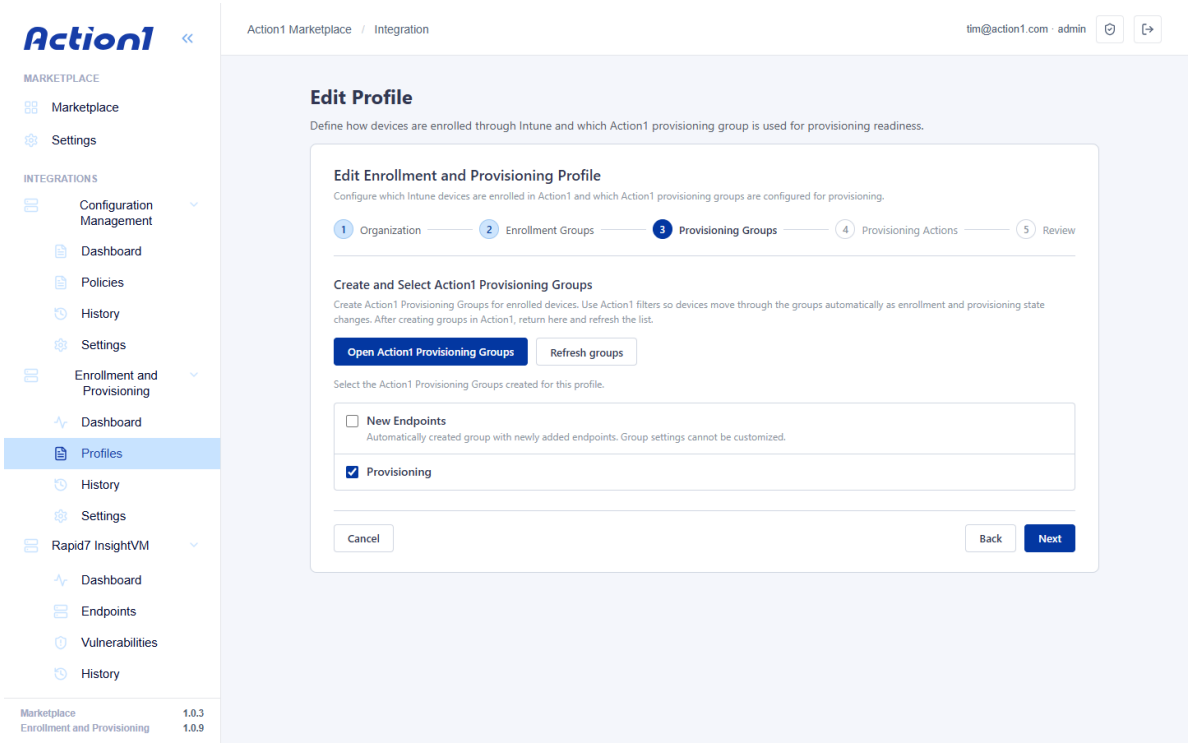

Current Enrollment Groups step showing Intune enrollment group selection.

For Autopilot, the Intune enrollment group should match the intended Autopilot device population. This keeps Autopilot assignment and Action1 enrollment aligned.

Profile Wizard Step 3 - Provisioning Groups

1. Create Action1 provisioning groups for enrolled devices.
2. Use Action1 filters so devices move through the groups automatically as enrollment and provisioning state changes.
3. Return to the Action1 Enrollment and Provisioning profile and refresh the list.
4. Select the Action1 provisioning groups created for this profile.

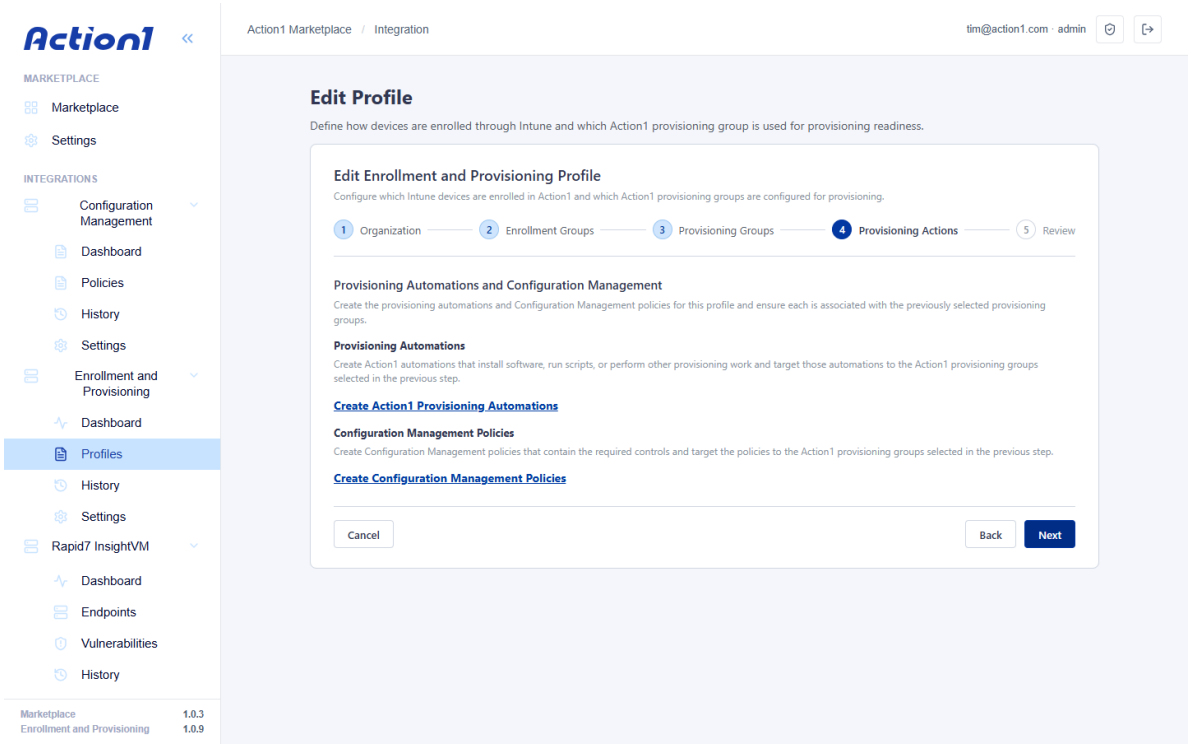

Current Provisioning Groups step showing Action1 provisioning group selection.

Profile Wizard Step 4 - Provisioning Actions

Create Action1 provisioning actions that install software, run scripts, or perform other provisioning work and target those actions to the Action1 provisioning groups selected in the previous step.

Create Configuration Management policies that contain the required controls and target the policies to the Action1 provisioning groups selected in the profile.

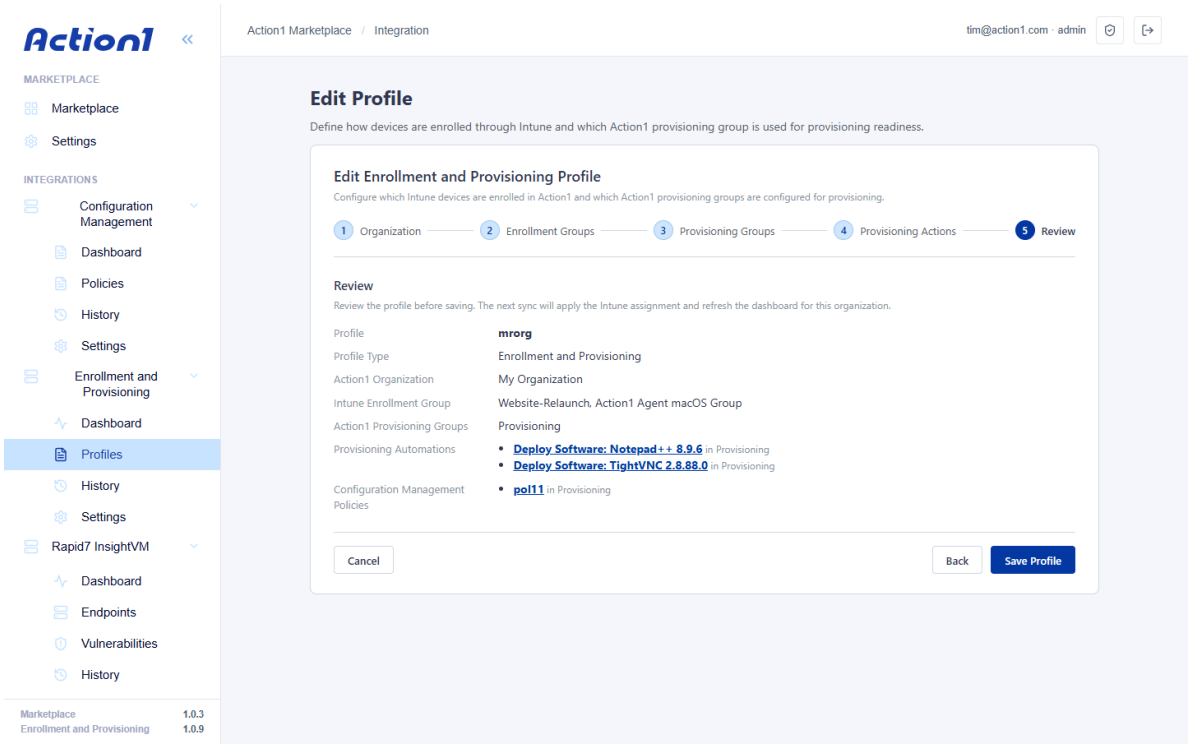

Provisioning Need	Action1 Control
Required applications	Deploy software through Action1 provisioning actions.
Device configuration	Apply scripts or Configuration Management policies.
Security baseline checks	Use Configuration Management policies and compliance results.
Readiness evidence	Review provisioning action history and policy compliance from the dashboard.

Current Provisioning Actions step for linking Action1 actions and Configuration Management policies to provisioning groups.

Profile Wizard Step 5 - Review and Save

1. Review the profile before saving.
2. Confirm the Action1 organization, Intune enrollment groups, Action1 provisioning groups, provisioning actions, and Configuration Management policies are correct.
3. Save the profile.

Current profile Review step before saving enrollment and provisioning changes.

Step 4 - Run the Autopilot Enrollment Workflow

1. Assign devices to the Autopilot deployment profile.
2. Confirm the same device set is included in the Intune enrollment group selected in the Action1 Enrollment and Provisioning profile.
3. Run an Intune sync from Action1 Enrollment and Provisioning after profile changes.
4. During Autopilot setup, Intune installs the required Action1 Agent app.
5. After the endpoint appears in Action1, provisioning groups and filters identify the device for provisioning.
6. Provisioning actions and Configuration Management policies run against the Action1 provisioning groups.
7. Use the Action1 Enrollment and Provisioning dashboard to confirm each endpoint reaches the expected provisioning status.

Operational Recommendation

Keep the Autopilot device group, Intune enrollment group, and Action1 provisioning groups documented together. When a device is missing from one layer, the dashboard may show enrollment without provisioning, provisioning without Intune assignment evidence, or an unexpected not-provisioned state.
